Customer Churn by Internet Service

Customer Churn by Technical Support

Customer Tenure by Churn Status

KEY INSIGHTS: WHY ARE CUSTOMERS LEAVING?

- Customers on month-to-month contracts have the highest churn risk, suggesting low commitment customers are easier to lose.
- Fiber optic customers show higher churn compared to other internet services, indicating possible service quality or pricing concerns.
- Customers without technical support have higher churn, highlighting the importance of customer assistance and issue resolution.
- Churned customers generally have shorter tenure, showing that early customer experience is critical for retention.

RECOMMENDATION

Focus retention efforts on new customers, month-to-month users, and customers without technical support through improved onboarding, support services, and targeted retention offers.

CONCLUSION

The analysis shows that customer churn is strongly associated with customer tenure, contract type, internet service, and availability of support services. Customers who are newer, on month-to-month contracts, using Fiber Optic services, and without technical support have a higher likelihood of leaving. These findings highlight that improving early customer experience and understanding customer needs are key to reducing churn.
